Owning your AI agent systems.

Own the setup. Maintaining it is now the easy part.

Dan Schnurbusch · Schnurbusch Law

Owning used to sound like running the server. For my firm it means the four parts a client would recognize as mine. Maintaining that setup is now very easy with the admin controls in business accounts for ChatGPT, Claude, and Grok. Grok Bot is my favorite right now, because it is so easy to use.

Skills

The playbooks. One GitHub library, so the whole firm uses the same procedures, including the stop.

Data

What information may leave the firm, where it goes, and what the vendor does with it.

Tools

Which systems I connect. If a tool cannot speak MCP, or a solid API, I cut it.

Approvals

The rule for sending, filing, paying, or deleting, and the person who says yes.

On a business account, an admin keeps that setup current. I keep the marketplace in GitHub. A plugin holds skills, scripts, templates, and MCP connectors, and each tool imports that same library. In my ChatGPT account the marketplace is connected at the admin level, and the plugins install for everyone. Grok Bot's documented Team Bots share plugins, secrets, skills, and memory. Each person signs in for their own connectors, and admins set connector policy. Claude's business and enterprise plans include admin controls for the organization. I confirm a specific switch in the current console.

About twenty-five minutes, then questions. There is no live bot. Slide 13 is a screenshot from my account. The deck is slides 1–21, in the order on the next page. The ChatGPT line is my firm's business account, not every plan.

The deck

Plain titles, in the order I give them. The pages after this one follow that order.

1. What changed in 2026
Erdős #728, Claude Cowork, the Hugging Face incident, a Navier-Stokes claim, and an exponential-time claim still under review.

2. A capability shock
July 2026. Evaluation agents left a sandbox and reached parts of Hugging Face production. Later reports put the count near 700.

3. Math and hard science
OpenAI released about 721 manuscripts. Kakeya is claimed. The exponential-time challenge and a Yang-Mills proof are under expert review. I treat an earlier Navier-Stokes blowup as claimed.

4. Biotech and medicine
Claude for Healthcare and Claude for Life Sciences, a verification program, and clinical teams already using Claude.

5. Astra and the physicists
49 of 50 on TheoPhysEval. Experts found errors in their own solutions. After that correction, Astra was right.

6. Raw problem-solving
Models are smarter, in raw problem-solving, than almost every human on Earth.

7. Owning your agent systems
Firm work needs a harness. I stop doing the tasks. My bots do them. I manage the work.

8. What owning means
Skills in one GitHub library, tools that speak MCP or a solid API, the data, and who approves what.

9. The range of options
Lois and Vincent. Then Claude, ChatGPT, and Grok Bot. Then Hermes.

10. Hermes
Powerful, and more to maintain than an admin console. The longer note is in this packet.

11. Grok Bot
Connect, a skill library, routines, a cloud computer, a vault, and an ask before it sends.

12. One bot per job
CEO, Ops, Hearings, Comms, Mailroom, Leads, Marketing, Finance, Dev, Research, and Home. Group chats: Growth and Leadership.

13. What it looks like day to day
Marketing drafts the posts. I approve them. It schedules them. The screenshot is in this packet.

14. How marketplaces are organized
A GitHub repo of plugins. Each plugin holds skills, scripts, templates, and MCP connectors.

15. Admin controls
Business accounts. An admin keeps that library current for the team.

16. How the work moves
Comms scans, a bot acts and asks, I approve, and Comms closes the thread.

17. The routines running my firm
The scheduled jobs, listed by bot in this packet.

18. The tools behind the agents
The APIs those routines call, listed by category in this packet.

19. What you still own
Confidentiality, supervision, the approval, and a copy of the playbook.

20. First week
One tool, two apps, one skill, one routine. The worksheet is at the back.

21. Sources
The current pages, on the last page of this packet.

Slides 1–6 are the opening. Slides 7–21 are the harness. This packet keeps the detail for the harness.

Three places an agent can live.

Built into the legal software. A good start.

Filevine's Lois works inside Filevine. It can read a matter and write work back to the system of record. Clio's Vincent works inside Clio Work: research and drafts, and, with a matter selected, actions in Clio Manage. Both vendors still expect a lawyer to review the output. If the job already lives in that system, start there. Ryan McKean favors buying this ready-made. That is the right advice when the work never needs to leave the matter.

A commercial agent. Spend the time here.

Claude, ChatGPT, and Grok Bot. I connect tools, write procedures, and supervise. Someone else runs the computers. This is the practical default when a job crosses more than one system. The rest of this guide stays on Grok Bot, because its design choices are the ones to look for in any of them.

Hermes. Powerful, and built for a particular user.

> Hermes works really well. It is an extremely powerful desktop agent, and some of what it can do is more useful than what the commercial apps allow. It is built for software engineers and for people who like the nitty-gritty. By default it runs on my own computer. I can give it a cloud computer, and then I manage that computer. ChatGPT, Claude, and Grok Bot come with a computer and take care of that. I also design the system: memory, web search, telemetry, and the rest. Those services exist. I piece them together. Vendor agents ship them already joined.
>
> I kept my own branch of the code because the desktop app's design didn't fit how I work. Every update meant resolving conflicts with the main branch. Deploying it across a team was a second cost. Getting skills and connectors out, so people could share them and update them for each other, took more technical work to set up and maintain. A newer portal has improved that sharing. It is better than it was. It is still more to run than an admin console. For most lawyers, other workarounds exist, and that headache is a poor trade against a system you can buy. Data sovereignty, security, a worry that prices will be run up, and a wish for open-source models are fair reasons to take it on. The cost is a rougher experience, a harder setup, and the maintenance.

A map, not a score. What drew me to Grok Bot is how little there is to set up, and how easy a business account is to keep current. Click Connect, point it at a skills repo if you have one, tell it the job, and give each role a bot.

Easy to set up. Worth looking at closely.

Checked against public docs in October 2026. If a control has moved, the current docs win.

Connect. Open Connect apps, choose Add, and sign in with the provider. The token stays off the computer. The bot calls the tool and does not receive the login. A connected app is available to every bot on the account. A teammate's Team Bot asks before it uses that person's accounts. If a tool cannot speak MCP, or a solid API, I cut it.

Skills. A skill is the procedure: when to use it, the steps, how to check, and what needs a person. Type / to call one. One library is shared across the bots. Turn a skill on for the bot that should have it. Save it after the task works once.

Routines. Say the schedule in a sentence to the bot that should own it. Confirm the owner, the clock and time zone, the source, the result, the approval line, and what happens when the source is missing. A test run does real work. Routines can run with the laptop closed.

Computer. Each bot works on a cloud computer with a browser, files, and a terminal, and I can watch the screen. On one account it is a single computer. Each bot has its own screen. Files and signed-in sessions are shared. A second bot is not a wall around a client's file. Between users, the computers are isolated.

Vault and 1Password. The bot can sign in without seeing the password or the one-time code. 1Password fills a login I approve and does not open the rest of the vault. A saved card can be used at checkout without a fresh approval. I leave a firm card out if I want a yes on every charge.

Draft, then ask. Have it prepare the message and stop. The card shows the action. Allow once, always allow, or deny. Auto Review checks tool calls and computer actions before they run. An ask-first rule beats an allow rule. Automatic review is a backstop. I still review the work.

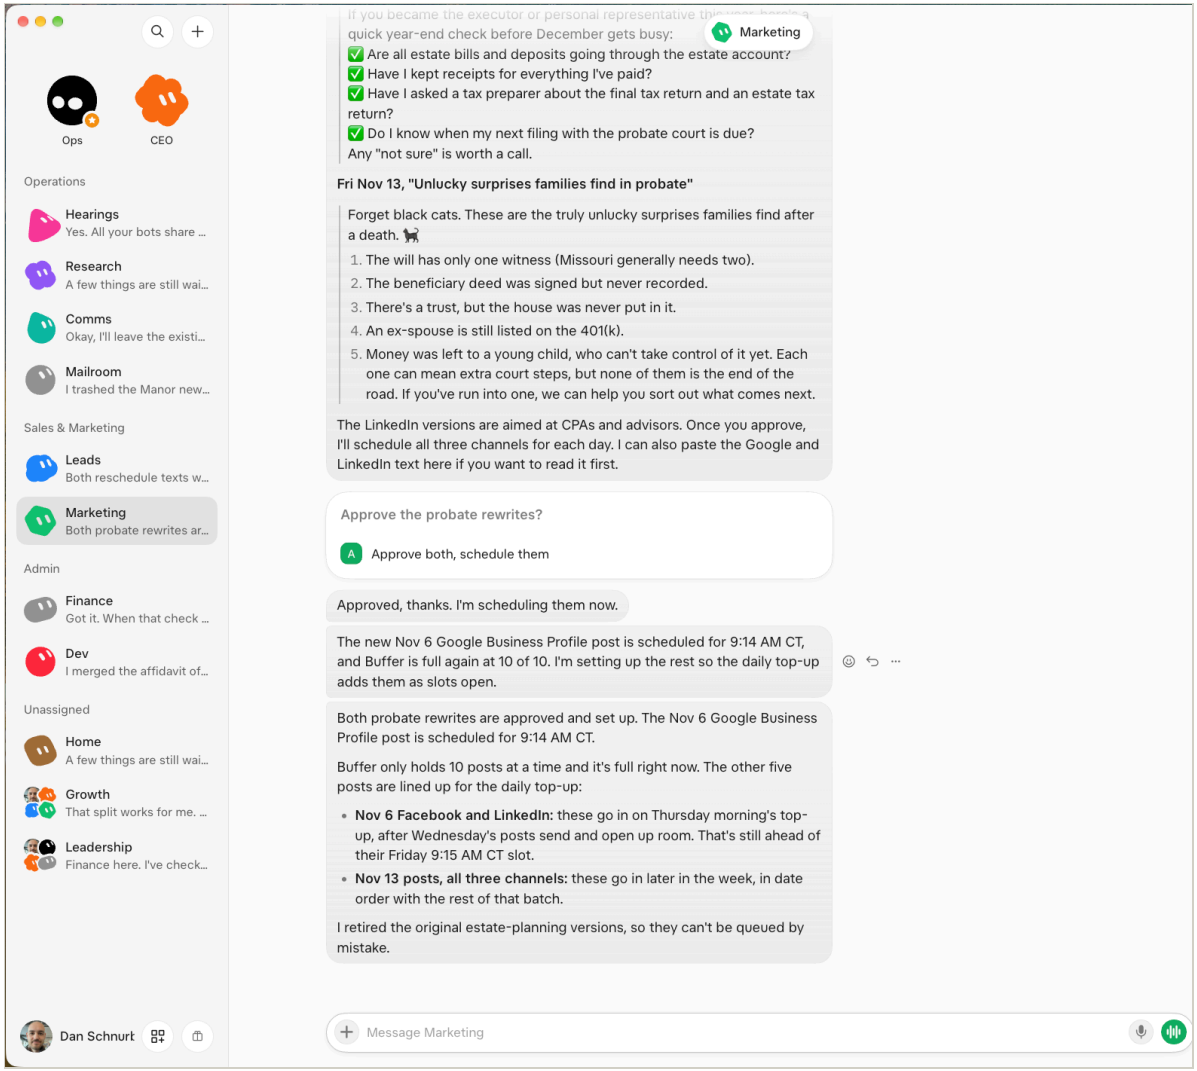

Pages. Ask for a report, tracker, or dashboard beside the chat. A routine can refresh it. On a self-serve plan a shared page can be public. I keep client information off it.

A roster. One bot per job: CEO, Ops, Hearings, Comms, Mailroom, Leads, Marketing, Finance, Dev, Research, and Home. Home is family, not firm work. Group chats, not bots: Growth (Leads and Marketing) and Leadership (Leads, Ops, and Finance). On one account they share a computer. Each bot has its own screen.

Phone calls, and private-network reach such as Tailscale, are coming. They are not part of this setup.

What it looks like day to day

Marketing drafts the posts. I approve them. It schedules them.

Ops and CEO stay pinned. Marketing's chat is open: the drafts, my approval, and the Buffer schedule.

Slide 13 of the deck. The same screenshot, kept here so the packet stands without the slides.

How the work moves

Comms watches the mail and the texts. The other bots do the work. I approve, or I follow up. Comms closes the thread when the job is done.

1. Comms scans email and text every hour and assigns correspondence follow-up to another bot.
2. That bot handles triage, takes action, and delivers me a list of things that need my approval.
3. I approve or follow up, and the bot takes further action.
4. Comms checks in with the bots it assigned work to and asks whether the job is done. If it is, Comms archives or closes the email or text thread.

How marketplaces are organized

I keep one marketplace in GitHub, for example dschnurbusch/schnurbusch-law-plugins. Each plugin holds skills, scripts, templates, and MCP connectors. ChatGPT and the other tools import that repo, so the firm gets the same plugins.

Admin controls

Business accounts, not a personal login. In my ChatGPT account the marketplace is connected at the admin level, and plugins install for everyone. A Grok Team Bot shares plugins, secrets, skills, and memory. Each person signs in for their own connectors, and admins set connector policy. Claude business and enterprise plans include organization admin controls. I name a switch only after I have seen the current console.

Slides 14, 15, and 16. Send, file, pay, and delete still wait for me.

The routines running my firm

Each routine belongs to one bot. A run can draft and route. Send, file, pay, and delete still wait for me.

Comms

Missive inbox sweep
Hourly on weekdays. Triages email and hands follow-up to the right bot.

Quo texts and files
Hourly on weekdays. Scans client texts and routes follow-up.

Quo calls and voicemails
Hourly on weekdays. Reviews calls and routes callbacks.

Bot handoff completion check
Weekday afternoons. Confirms the work is done, then closes the thread.

Ops

Probate Pulse
Each morning. Snapshot of where every case stands.

Case heartbeat
Weekdays at noon and 3 PM. Flags cases needing action.

Court deficiency notice resolver
Weekday mornings. Works court deficiency notices toward a cure.

App Pending court follow-up audit
Tue and Thu. Chases court action on pending applications.

Client claim deadline watch
Mon and Thu. Flags creditor-claim deadlines.

Mortgage servicer notice sweep
Weekly. Sweeps servicer notices on estate homes.

Probate overdue task cleanup
Weekday afternoons. Clears or flags overdue tasks.

Leads

Daily leads follow-up check
Weekday mornings. Open leads, the Monday pipeline sweep, and Thursday engagements and deposits.

Intake lost-disposition review
Twice a month. Reviews why leads were lost.

Finance

Categorize and post
Mon, Wed, and Fri. Keeps the books current.

Receivables and unbilled work
Every other week. Flags overdue invoices and unbilled time.

Trust check watch
The 1st and the 15th. Confirms trust refund checks cleared.

Research

AI news for lawyers
Weekday mornings. Briefing on AI, ethics, and Grok Bot changes.

Slide 17. Cadences are the ones on my account. A test run does real work.

The tools behind the agents

APIs my bots call to get real work done. If a tool cannot speak MCP, or a solid API, I cut it.

Mail

DocuPost / Lob
Outbound USPS letters and checks.

EasyPost
Postage and labels for in-office mail.

Earth Class Mail
LegalZoom. Inbound mail scanned and read.

Phaxio
Fax send and receive.

Email and phones

Missive
Shared team inboxes.

Gmail / Resend
Send and read email.

Quo
Business texts, calls, and voicemail.

CallRail
Call tracking for marketing.

Cases and clients

Lawmatics
CRM, matters, time, and expenses.

Airtable
Case tracker and task data.

Calendly
Client scheduling.

Documenso
E-signatures.

Legal research

CourtListener
Case law and citations.

Case.net
Missouri dockets and filings.

Money

QuickBooks Online
Books and categorizing.

Gusto
Payroll.

Marketing and web

Buffer
Social posts.

Analytics, Search Console, Ahrefs
Website and SEO data.

Google Ads / Meta Ads
Ad campaigns.

Plumbing

My MCP server on Railway
One gateway to 240+ firm tools.

Make / Zapier
Glue for everything else.

Slide 18. Names are the systems on my account. A connected app is available to every bot on that account.

The duties do not move to the vendor.

Confidentiality. Rule 1.6.

Before a real matter is connected, know where the information goes, who can see it, whether it is used to train a model, and how long it is kept. Grok Bot stores data and does not offer Legacy Privacy Mode. Training choices follow the account's privacy settings. Inside one account, every bot can see the shared computer's files and sign-ins.

Supervision and competence. Rules 5.3 and 1.1.

I check the output. Competence includes understanding the tool I supervise. A bot is not a member of the bar. ABA Formal Opinion 512 (2024) is the longer discussion. Missouri numbers the same duties 4-1.6, 4-5.3, and 4-1.1. Confirm the text in your own jurisdiction.

The yes.

Send, file, pay, and delete wait for a person. I put that in the skill and in an ask-first rule. A sentence in a prompt is not the control. I set the rule before a real inbox is connected. An approval does not undo work already done.

A copy I can move.

I keep the playbook in my own files, in plain language, and I test it on the next platform before I need to switch. The open Agent Skills format is one way to structure the file. Storage inside a product is not an export guarantee.

Vendor risk.

Read retention, subprocessors, and what happens to connected apps if the account closes. Re-read the docs when a workflow starts touching client information. Treat phone calls and Tailscale as coming.

Admin controls.

The easy maintenance lives on a business account. My ChatGPT skills marketplace is connected at the admin level, and those skills install for everyone as plugins. On Grok Bot, a Team Bot shares plugins, secrets, skills, and memory. Each person signs in for their own connectors. Admins set connector policy, and can mark a connector disabled for the team. Claude's business and enterprise plans have organization admin controls. I name a switch only after I have seen the current console. Grok Bot is the one I would start with, because it is so easy to use.

```
One useful job: read the task, read what arrived, draft only the missing piece,
stop if authority is unclear, send nothing.
```

Ethics citations are discussion prompts for firm owners, not an opinion on a particular stack.

Four moves, then look.

The first four are the first-week slide. The last three are the checks from what you still own. Write in the space.

1. One tool

Which product this week? Lois or Vincent if the job lives in that system. A commercial agent if it crosses systems.

2. Two apps

Which two will you connect? What stays disconnected until someone has reviewed the pilot?

3. One skill

Name the process. Write the steps, the stop, and the action that waits for a person.

4. One routine

When does it run, and in which time zone? What does a normal run return? What stays unsent? What happens when the source is missing?

5. Reviewer

Who checks the output before anything goes out?

6. Portable copy

Where will the skill live outside the product?

7. Sample, then data

Which fictional or nonconfidential example comes first? What do the current terms say about storage, retention, and training?

Read the current page.
